BASIC-ABSTRACT:

NOVELTY - An ecological water channel of rivers is provided to create a habitat suitable for the commensalism and inhabitation of various fish, birds and insects, thus naturally protecting and maintaining an ecosystem around rivers.

DETAILED DESCRIPTION - The ecological water channel of rivers consists of a retaining wall(1) formed with a water passing hole(11) for the natural intake of ground water from a bank(6), a water channel forming wall(2) having an

**BEST AVAILABLE COPY**

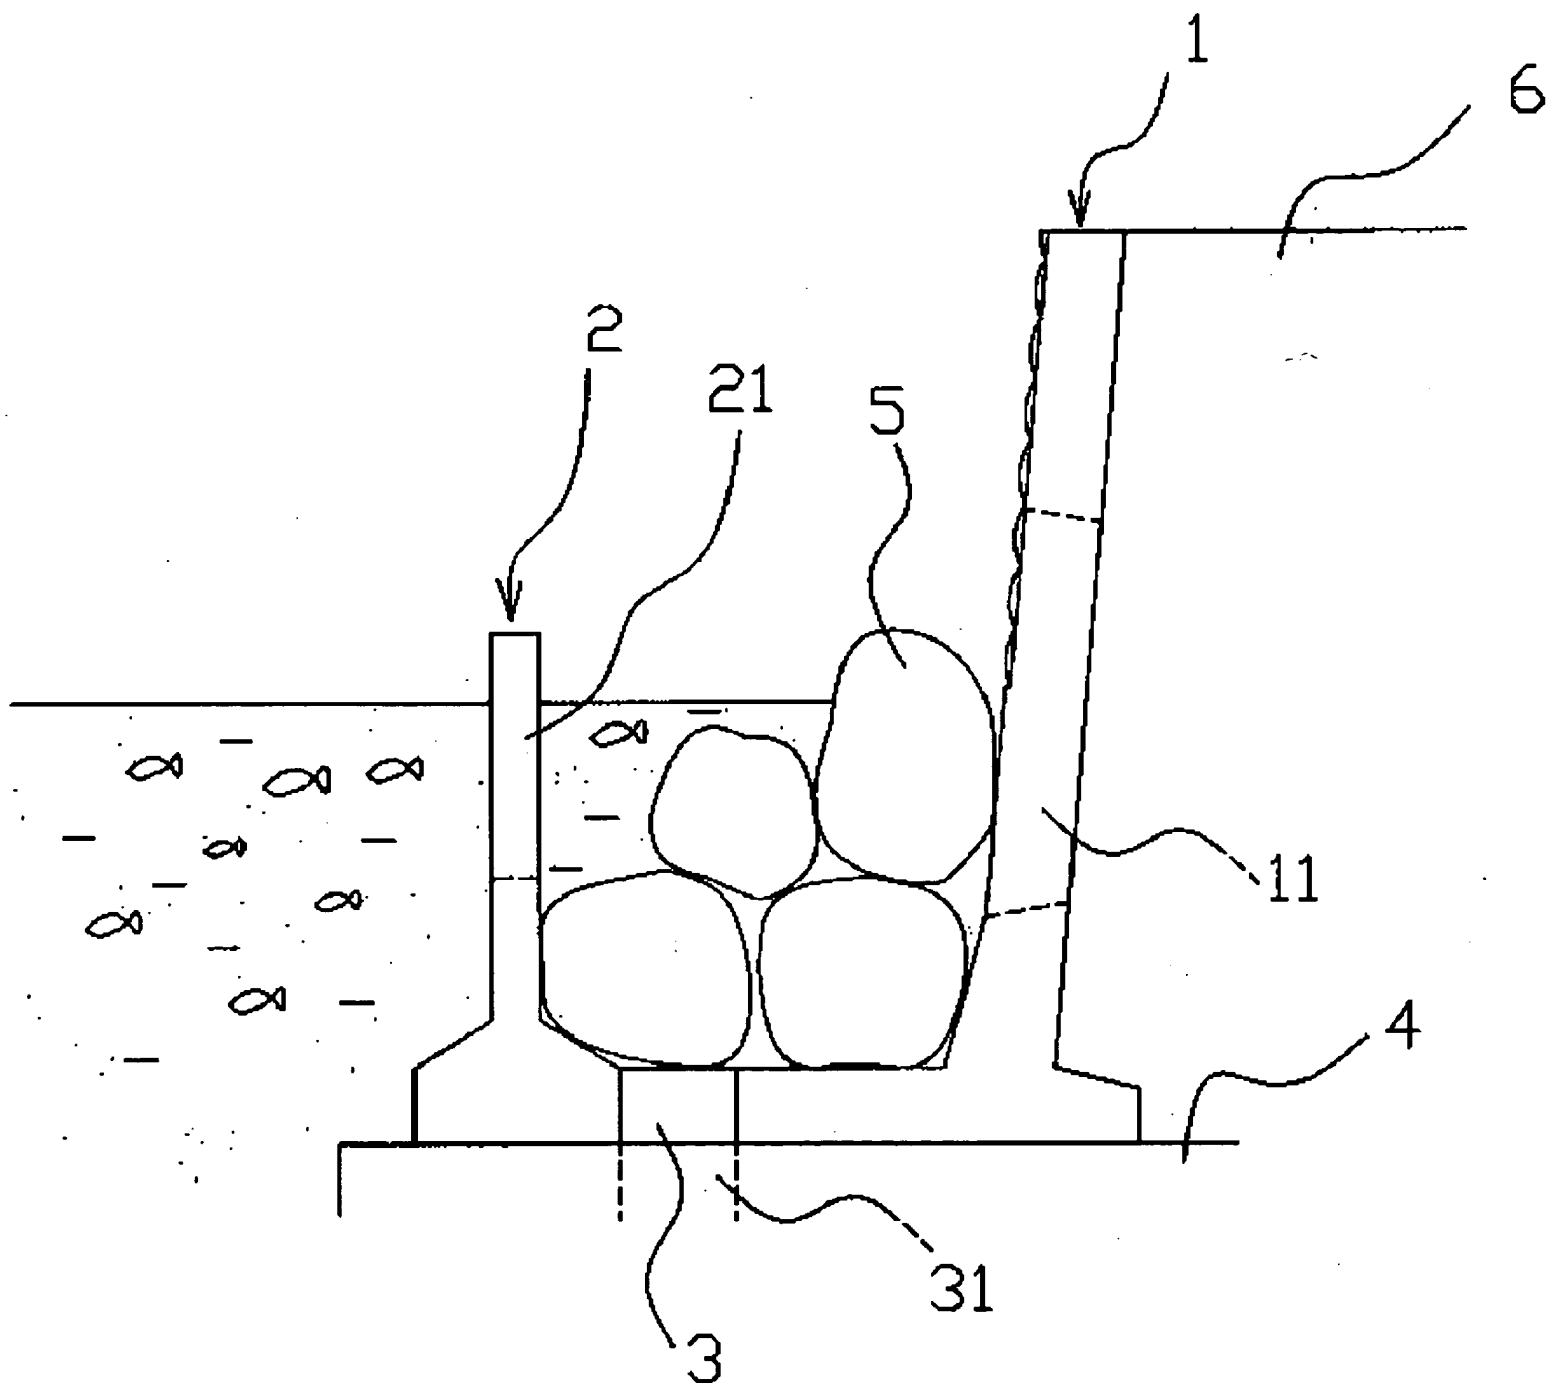

opening(21) for the intake of river water, and a bottom concrete part(3) connecting between the retaining wall and the water channel forming wall. The bottom concrete part is provided with a communicating portion(31) extending to the bottom of the river for the circulation of ecosystem. The formed water channel is filled with stones(5) of appropriate sizes.
